Zyvor Platform

Executive summary — modular enterprise infrastructure stack

hypercluster v0.1.0 · zyvor.dev · ssahani portfolio

Executive summary

The Zyvor platform is a vertically integrated stack for enterprise infrastructure — bare metal through Kubernetes, KubeVirt VMs, AI/GPU workloads, and VM migration.

19	6	16	60+
portfolio products	architecture layers	Aether migration paths	Forge CRDs

Composable

Each repo owns a domain — hypercluster bootstraps; Forge/Hermes/Zeus install into the cluster.

Offline-first migration

GuestKit + hyper2kvm fix guests before boot on KVM.

Kubernetes-native

Operators, CRDs, Helm charts; systemd for bare-metal daemons.

AI as embedded ops

Forge Zeus, Ragnarok healer, Veyron copilot — not bolt-on chatbots.

Design philosophy

Principle	Implementation
Composable	hypercluster bootstraps; sibling products install into cluster
One owner per domain	Migration = hyper2kvm; disk inspect = guestkit; network = packetwolf
K8s-native	Operators, CRDs, Helm; systemd for host daemons
Offline migration	GuestKit + hyper2kvm pre-boot guest fixes
